

Exporting PDF from the Professional program

The component that lets you export the content of PDF files to editable formats is called PDF Converter. Access it from the Convert PDF button in the File toolbar. Choose a direct conversion to be performed with current settings or choose the last item to open the PDF Converter Assistant for full control.

You can also perform direct conversions by selecting the Save As command from the File menu. You can extract and save only text from the document or save the file as image. Conversion between PDF and XPS file formats is also supported.
