

## Doctors on the move need tech that keeps up

Doctors are frustrated with time spent on clinical documentation and how it cuts into patient care – 88% report being moderately to severely stressed.

### Overwhelmed by documentation

**43%** of a doctor's workday is spent on data entry

**4,000 clicks** for an average day of documentation

**28%** The average time spent in direct contact with patients

### A call for portability

Doctors already use mobile phones for everyday tasks and are looking to make clinical documentation more portable too.

**12,138 steps** are taken by the average healthcare professional per day, 2.3 times more than the typical American

**80%** of doctors use a personal mobile device to communicate patient data

**89%** of CIOs say portability is a key priority

### The cloud delivers

When doctors use cloud-based dictation, documentation becomes portable and astoundingly fast.

**35%** of doctors using the cloud choose to dictate on a mobile device

**3X faster** than typing on a computer, dictation averages 150 words per minute

**2.5 hours saved** for every hour dictated

### Freedom comes at last

Cloud-based dictation is an antidote to burnout. It helps doctors feel better about documentation, more satisfied and freer to practice as they see fit.

**Doctors that use speech recognition have up to 2 hours freed per day to spend with patients**

**They feel more confident about technology and have a better experience**

**They move freely, spend more time with patients and can go home on time**

Say hello to cloud-based speech
